

Types of Columns

There are 3 types of columns based on how they are reinforced:

6" max

6'' > 6'

tied column (a)

3. composite column (c & d)

Column Reinforcing Tied Columns

University of Michigan, TCAUP

The ties restrain the expansion of the core concrete and the outward buckling of the longitudinal bars.

Longitudinal bars:

minimum for square columns is 4. minimum for round columns is 6. maximum spacing is 6"

Ties:

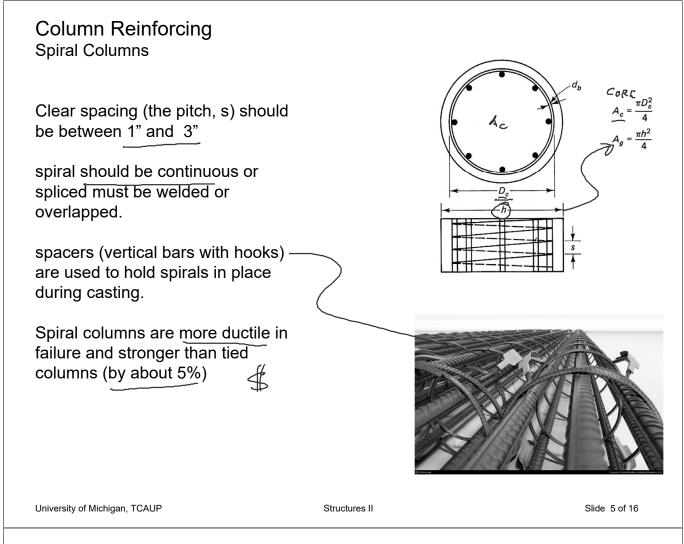

no less than #3 with #10 or less longitudinal steel.

no less than #4 with #11 and greater longitudinal steel. s tie spacing is the least of:

- 16 x longitudinal bar diameter
- <u>48</u> x tie diameter <u>3</u> x 4^e =1^e
- least width column crossties brace alternate
 - longitudinal bars or bars > 6" o.c.

-6" max

Column Design Considerations

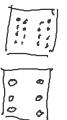

High strength concrete is more \checkmark effective than in beams.

Because steel is more expensive, it is better to increase column size and reduce steel needed.

Tied columns (particularly rectangular) are more economical than spiral. $\neg \Rightarrow$

But spiral columns with high strength. concrete reduce column size.

Larger bar sizes reduce congestion when casting. Bars can also be bundled.

Structures II

Column Modes of Failure

Stress distribution between steel and concrete varies under load and time, but ultimate failure is more predictable.

For design, failure is defined as the spalling of the cover concrete.

Even with the cover cracked the column will continue to carry load.

Spiral columns are tougher than tied

A column is a more critical member. It supports a greater area.

Therefore the Φ factor is lower. Φ = 0.65 for tied columns

 $\Phi = 0.75$ for spiral columns

Also: -

columns are more difficult to cast, and concrete carries more of the load than in beams

Axial Strength Design (no moment) **Tied Column Example** Given: $P_{DL} = 200 \text{ k}$ $P_{LL} = 300 \text{ k}$ f'c = 4000 psi fy = 60 000 psi $P_{\rm H} = 1.4(200) + 1.7(300)$ Required: column size and reinforcement = 280+ 510 = 7 1. Find factored axial load Pu (apply λ factor for load case). Pu = 40.80[0.85 Fe (Agt 2. Choose $\rho = As/Ag$ (0.01 min., 0.08 max.) $\phi = 0.65$ FOR TIED COLU FOR p = 0.02 As = pAg. assume $\rho = 0.02$ (good economically). 790 = 0.65(0.80) 0.85(4)(A + 60 (0.02 (Ag 3. Find concrete Ag based on p $P_u = \Phi P_n = \Phi 0.80 [0.85f'c (A_a - A_s) + f_v A_s]$ 790 = 2.3566 Ag $Ag = 335.2 in^2$ 4. Choose column section based on Ag ASSUME SAURE SECTION 1335.2 = 18.31 in ROUND UP TO WHOLE INCH, SAY 19 × 19 Slide 11 of 16 University of Michigan, TCAUP Structures II

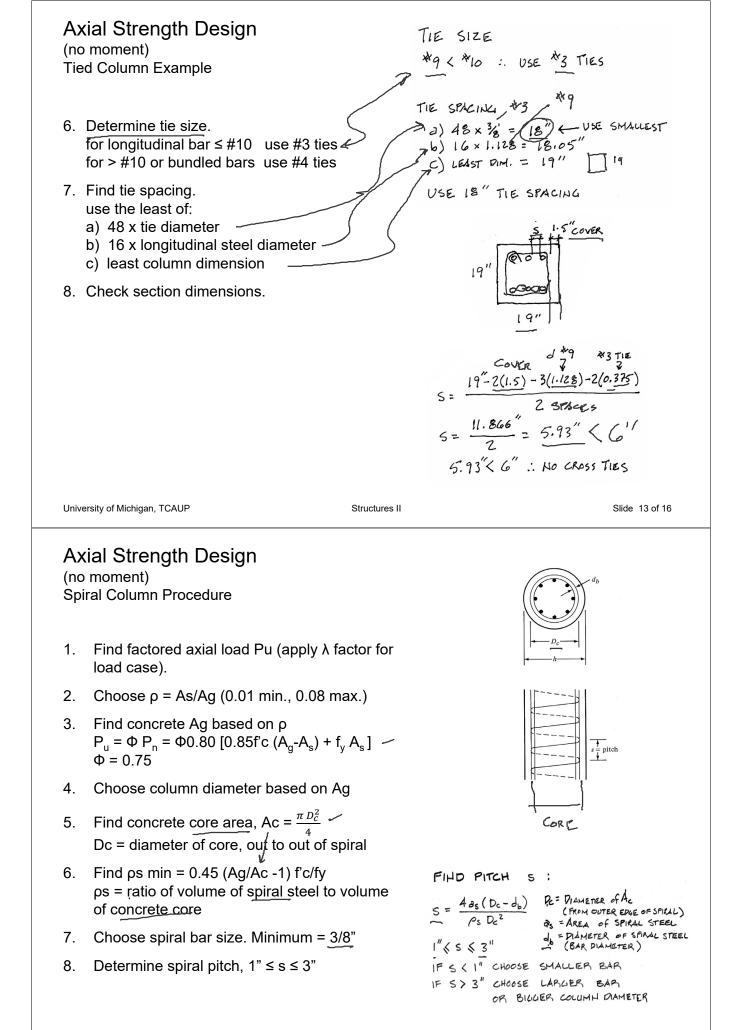

Axial Strength Design (no moment)

Tied Column Example

5. Find steel As based on concrete Ag. Choose bar size and number

USE
$$Ag = 19 \times 19 = 361 \text{ in}^2$$

FIND AS
 $P_U = \Phi 0.80 [0.85 \text{ f}'_c (Ag - A_s) + fy A_s]$
 A_g
 $790 = 0.65(0.80) [0.25(4)(361 - A_s) + 60A_s]$
 $790 = 638.2 + 29.43 \text{ As}$
 $A_s = 5.16 \text{ in}^2$ USE 6 $\frac{19}{9} \frac{8485}{5} = 6.0 \text{ in}^2$
 $= 6$
 $= 6$
 $= 6$
 $= 6$

Combined Axial + Flexure

Bending moments are almost always present due to columns being continuously cast with beams.

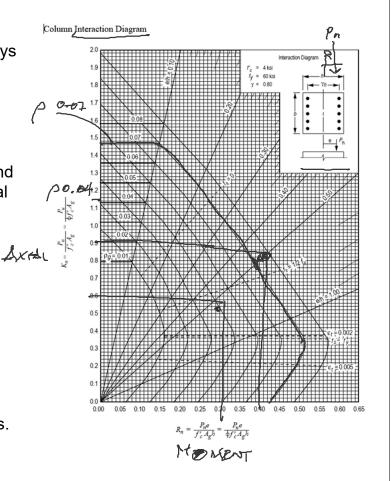

Solutions are normally found using interaction diagrams.

Axial force is on the vertical axis and the flexure moment is the horizontal

Each curve is for a different $\boldsymbol{\rho}$

Graphs are for specific bar arrangements, f'c and fy

- 1. Choose section dimensions
- 2. Calculate Kn and Rn
- 3. Find ρ
- 4. Determine $As = \rho Ag$
- 5. Check bar spacing, Ag and ties.
