Concrete Beam Design 3/29
HW - Concrete Beam Design
Lab - Reinforcement Placement

## Structure II <br> Section 004

Yifan Ma
yifanma@umich.edu

Using the Ultimate Strength Method, analyze the giver section to determine its safe moment capacity, Mu, based on the given parameters. Check that the section is tension controlled (epsilon_t > 0.005), and that the amount of steel, As is more than the minimum, As_min.

## HW - Concrete Beam Design

## Data:

Load and Span
Material properties - f'c, fy All section dimensions: $h$ and $b_{h}$

Required:
Steel area - As

1. Calculate the factored load and find factored required moment, Mu
2. Find $d=h-$ cover - stirrup $-d_{b} / 2$ $M_{u}=\frac{\left(\gamma w_{D L}+\gamma w_{L L}\right) l^{2}}{8}$ (one layer)
3. Estimate moment arm $z=j d$. For beams $\mathrm{j} \approx 0.9$ for slabs $\mathrm{j} \approx 0.95$
4. Estimate As based on estimate of jd.
(0.003 in./in.)

5. Use As to find a
6. Use a to find As (repeat... until 2\% accuracy)

7. Choose bars for As and check As max \& min
8. Check that $\varepsilon_{t} \geq 0.005$
9. Check $\mathrm{Mu} \leq \phi \mathrm{Mn}$ (final condition)

$$
M_{n}=A_{s} f_{y}\left(d-\frac{a}{2}\right)
$$

## 1. Unfactored dead load on beam from slab

$$
\begin{aligned}
& 1 / 2^{*} \text { Span A * Slab thickness * } 150 \text { pcf } \\
& =1 / 2^{*} 19^{*} 12 / 12^{*} 150 \\
& =1425 \text { plf }
\end{aligned}
$$

## 2. Unfactored dead load on beam from the beam(PLF)(beam selfweight)

$$
\text { b * } h * 150=18 / 12 * 39 / 12 * 150=731.25 \text { plf }
$$

## 3. Unfactored live load on beam, LL

$$
\text { LL }=\text { LLfloor * }\left(\text { Span A) } / 2=45^{*} 19 / 2=427.5\right. \text { plf }
$$

4. Total factored beam load, wu

$$
w u=1.2^{*} \mathrm{DL}+1.6^{*} \mathrm{LL}=1.2 *(1425+731.25)+1.6^{*} 427.5=3271.5 \mathrm{plf}
$$

## 5. Factored design moment from the loads, Mu

$$
\mathrm{Mu}=1 / 8^{*} \mathrm{wu}(\text { Spanbeam })^{\wedge} 2=1 / 8^{*} 3271.5^{*} 30^{2}=368.04 \mathrm{ft}-\mathrm{k}
$$

Using the Ultimate Strength Method, analyze the given section to determine its safe moment capacity, Mu based on the given parameters. Check that the section is tension controlled (epsilon_t > 0.005), and that the amount of steel, As is more than the minimum, As_min.

\section*{LAB - Reinforcement Placement}

\section*{Procedure}
1. For the example beam worked in class, determine the required spacing, \(\mathrm{s}_{\mathrm{v}}\) and \(\mathrm{s}_{\mathrm{h}}\), for the bar size used.
2. For the given stirrup size determine the bend radius for a \(90^{\circ}\) bend.
3. Make a sketch showing the proper locations of bars and the stirrup including cover.
4. Draw and dimension the depth of the stress block, "a" and the distance to the N.A. from the top of the beam, " c ".
5. Dimension and label "d" and "dc"

Table 25.3.2-Minimum inside bend diameters and standard hook geometry for stirrups, ties, and hoops

\section*{Goals}

To determine bar diameters and horizontal spacing.
To find the placement and dimensions of a shear stirrup.
To establish proper cover for reinforcement. To draw all beam elements in the proper scale and location.

Horizontal Spacing in Beams ACI 25.2.1

1 inch

\(\pi_{\text {A standard hook for stirrups, ties, and hoops includes the specific inside bend diameter and straight extension length. It shall }}\) be permitted to use a longer straight extension at the end of a hook. A longer extension shall not be considered to increase the anchorage capacity of the hook

Flexural bar \#9
\[
b=15 "
\]
db=1.128"
5 Flexural bars
Stirrup bar \#4
db=0.5"
Aggregate \(=3 / 4 "\)

Cover 1.5"
- For the given stirrup size determine the bend radius for a \(90^{\circ}\) bend.

Minimum inside bend diameter \(=4 \mathrm{db}\)
Minimum inside bend radius?

- Make a sketch showing the proper locations of bars and the stirrup including cover.

Determine put 5 bars in one layer or two layers.
Meet the spacing requirement.

One layer does not pass!

- Make a sketch showing the proper locations of bars and the stirrup including cover.

Put 5 bars in two layers!
- Draw and dimension the depth of the stress block, "a" and the distance to the N.A. from the top of the beam, "c"
\[
a=7.843^{\prime \prime} \quad c=9.227^{\prime \prime}
\]
- Dimension and label "d" and "dc".

\[
\mathrm{y} 1=\mathrm{db} / 2
\]

\(y 2=d b+S v+d b / 2\)
the centroid \(\bar{y}=\frac{\sum \mathbf{A} \times d_{x}}{\sum \mathbf{A}}=(3 y 1+2 y 2) / 5 \quad d=h-d c\)
