revise adjustment factors:

$C_F = (12/23.5)^{1/9} = 0.928$

$R_B = \sqrt{\frac{\ell_e d}{b^2}} = \sqrt{\frac{126.5(23.5)}{13.5^2}} = 4.039$

3.5 Bending Members – Deflection

3.5.1 Deflection Calculations

If deflection is a factor in design, it shall be calculated by standard methods of engineering mechanics considering bending deflections and, when applicable, shear deflections. Consideration for shear deflection is required when the reference modulus of elasticity has not been adjusted to include the effects of shear deflection (see Appendix F).

3.5.2 Long-Term Loading

Where total deflection under long-term loading must be limited, increasing member size is one way to provide extra stiffness to allow for this time dependent deformation (see Appendix F). Total deflection, Δ_T, shall be calculated as follows:

$$\Delta_T = K_{cr}\,\Delta_{LT} + \Delta_{ST} \qquad (3.5\text{-}1)$$

where:

K_{cr} = time dependent deformation (creep) factor

= 1.5 for seasoned lumber, structural glued laminated timber, prefabricated wood I-joists, or structural composite lumber used in dry service conditions as defined in 4.1.4, 5.1.4, 7.1.4, and 8.1.4, respectively.

check support bearing:

3.10.4 Bearing Area Factor, C_b

Reference compression design values perpendicular to grain, $F_{c\perp}$, apply to bearings of any length at the ends of a member, and to all bearings 6" or more in length at any other location. For bearings less than 6" in length and not nearer than 3" to the end of a member, the reference compression design value perpendicular to grain, $F_{c\perp}$, shall be permitted to be multiplied by the following bearing area factor, C_b:

$$C_b = \frac{\ell_b + 0.375}{\ell_b} \qquad (3.10\text{-}2)$$

where:

ℓ_b = bearing length measured parallel to grain, in.

Equation 3.10-2 gives the following bearing area factors, C_b, for the indicated bearing length on such small areas as plates and washers:

Table 3.10.4 Bearing Area Factors, C_b

ℓ_b	0.5"	1"	1.5"	2"	3"	4"	6" or more
C_b	1.75	1.38	1.25	1.19	1.13	1.10	1.00

For round bearing areas such as washers, the bearing length, ℓ_b, shall be equal to the diameter.

FIND MINIMUM ℓ_b:

$F_{c\perp} = 455$ PSI

$F_{c\perp}' = F_{c\perp}(C_M\ C_t\ C_i\ C_b)$

$= 455(1.0\ 1.0\ 1.0\ 1.0) = 455$ PSI

R = END REACTION $= \frac{P}{2} + \frac{w\ell}{2} = 6251.9$ LBS

$F_{c\perp}' = f_{c\perp} = \frac{R}{A_b} = \frac{6251.9}{b\,\ell_b} = 455$ PSI

$\ell_b = \frac{6251.9 \text{ LB}}{13.5'' \; 455 \text{ PSI}} = 1.02''$ (MINIMUM)
