SIZE CATAGORIES

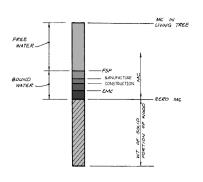

SIZE CATAGORIES

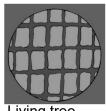

Symbol	Name	Nominal dimensions		
		Thickness	Width	Examples of sizes
LF SLF	Light Framing and Structural Light Framing	2 to 4 in.	2 to 4 in.	$2 \times 2, 2 \times 4, 4 \times 4$
SJ&P	Structural Joist and Plank	2 to 4 in.	5 in. and wider	$2 imes 6, 2 imes 14, \ 4 imes 10$
	Stud	2 to 4 in.	2 to 6 in.	$2 \times 4, 2 \times 6, 4 \times 6$ (lengths limited to 10 ft and shorter)
	Decking*	2 to 4 in.	4 in. and wider	$2 \times 4, 2 \times 8, 4 \times 6$
B&S	Beams and Stringers	5 in. and thicker	More than 2 in. greater than thickness	$6 \times 10, 6 \times 14, 12 \times 16$
P&T	Posts and Timbers	5 in. and thicker	Not more than 2 in. greater than thickness	$6 \times 6, 6 \times 8, \\ 12 \times 14$

 $\ast \dot{D} ecking$ is normally stressed about its minor axis. In this book, all other bending members are assumed to be stressed about the major axis of the cross section, unless otherwise noted.

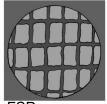

Moisture Content

- MC = %water to oven dry wood
- In a living tree, MC can be 200%
- "free water" is contained in cell cavity
- "bound water" is within the cell wall
- Fiber Saturation Point (FSP) is the MC at 0% free and 100% bound water FSP is about 30%
- Equilibrium Moisture Content (EMC) is reached in service

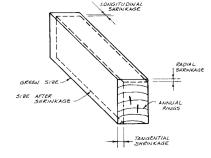

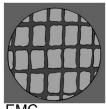

FSP

- Shrinkage begins once MC<FSP
- Shrinkage is not the same in each direction
- Uncontrolled shrinkage results in splits

EMC

Wood Structures

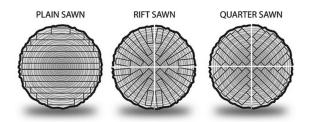

Slide 5/18

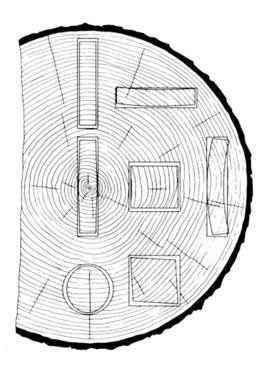

Shrinkage

- Is different in different directions
- Longitudinal is the least
- Across the grain is more
- Circumferential is greatest

Cut

- Plain Sawn most economical and common
- Quarter Sawn less warping
- Rift Sawn least warping but more waste

Yard Dry

- · Initial free water is removed
- stacked separated by 1" stickers
- · Air dried outdoors or under cover
- Dry rate depends on humidity and circulation
- Coating ends reduces splitting
- Takes ~ weeks to months

Kiln Dry - KD

- · Enclosed in humidity controlled chamber
- Introduction of controlled heat
- Air circulation
- Dried to < %18

Heat Treated - HT

- temperature raised to 53° C (127° F) for 30 min.
- kills organisms
- · requirement for imports

GRADING

Visual Grading

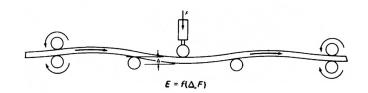

Each member is assessed for visual defects. (splits, knots, density, etc.)

Machine Evaluated Lumber (MEL)

Each member is assessed for density using x-ray technology.

Machine Stress Rated (MSR)

Each member is stressed by running it through rollers which measure the deflection and stiffness. The E modulus in bending can be calculated from the deflection.

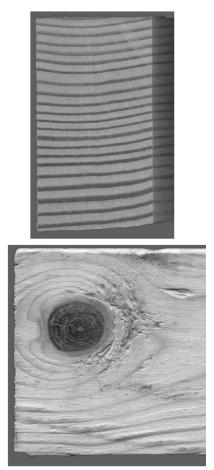

GROWTH CHARACTERISTICS

Annual Rings

- Latewood is denser and stronger than earlywood.
- Sapwood is the actively living part of the tree. It is younger and transports water more readily than heartwood. The strength of the two is about the same.
- Density can be gauged visually by noting the % of latewood to earlywood

Knots

- Knots result from tree branches
- Knots weaken the member and effect the grading

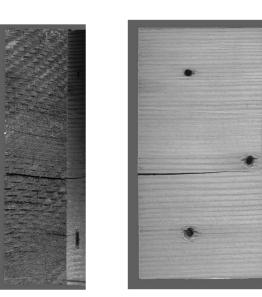

University of Michigan, TCAUP

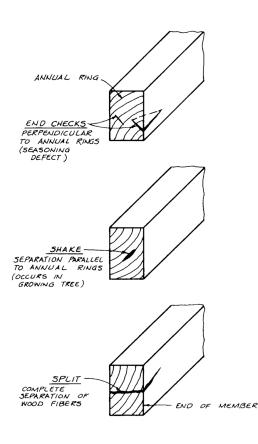

Structures II

Slide 9 of 21

Checks, Shakes and Splits

- All three are defects which weaken the wood
- Checks and splits are seasoning defects
- Shakes result from stress in the growing tree

University of Michigan, TCAUP

Slope of Grain

- The slope of the grain is taken in relation to the long edge of the member
- It is measured as a ratio e.g. 1" in 8"
- Increase in slope lowers the strength of the member

 Untrimmed bark or wood that is missing along the edge or corner of cut lumber

Pressure treating and Incising

- When wood is kept dry there is generally no problem with decay. When M.C. exceeds 19% problems can result.
- Contact with soil or concrete should be avoided.
- To prevent mold or rot, a chemical preservative can be impregnated in the wood under pressure (pressure treated).
- Some wood accepts pressure treatment well (e.g. Southern Pine) while others not so well. To aid in the chemical penetration the wood surface can be incised with small cuts to increase the surface area. This however has a detrimental effect on the strength and E modulus.

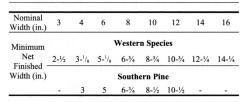

Glulam

- Glue laminated lumber
- Stress rated and graded
- Parallel grain
- Different finish grades
- Standard widths and lams
- Straight or curved
- Size limit by transportation
- Stock or custom dimensions

Wood Structural Panels

- Plywood cross laminated wood veneer panels pressed and glued.
- **Oriented Strand Board** (OSB) cross laminated layers of wood strands or wafers, compressed and glued
- Composite Panel wood or plastic veneer and reconstituted wood based material

Wood Structural Panels

 Cross Laminated Timber (CLT) – cross laminated wood panels using at least three layers of boards or dimensioned lumber pressed and glued together. Thickness of layers varies from 5/8 inch to 2.0 inches. The width to pieces may vary from 2.4 to 9.5 inches. Panels are produced in different widths – commonly: 2 ft., 4 ft., 8 ft., 10 ft. and up to 60 ft. length.
