C_{fu} Flat Use (Supplement)

C_r Repetitive Member Factor (Supplement)

Flat Use Factor, C_{fu}

Bending design values adjusted by size factors are based on edgewise use (load applied to narrow face). When dimension lumber is used flatwise (load applied to wide face), the bending design value, F_b, shall also be permitted to be multiplied by the following flat use factors:

Flat Use Factors, Cfu

3.3.3 Beam Stability Factor, C.

- 3.3.3.1 When the depth of a bending member does not exceed its breadth, $d \le b$, no lateral support is required and $C_L = 1.0$.
- 3.3.3.2 When rectangular sawn lumber bending members are laterally supported in accordance with 4.4.1, $C_L = 1.0$.
- 3.3.3.3 When the compression edge of a bending member is supported throughout its length to prevent lateral displacement, and the ends at points of bearing have lateral support to prevent rotation, $C_L = 1.0$.

2012 NDS

4.4.1 Stability of Bending Members

- 2x4 (a) $d/b \le 2$; no lateral support shall be required.
- 2x6-8 (b) 2 < d/b ≤ 4; the ends shall be held in position, as by full depth solid blocking, bridging, hangers, nailing, or bolting to other framing members, or other acceptable means.
- 2x10 (c) 4 < d/b ≤ 5; the compression edge of the member shall be held in line for its entire length to prevent lateral displacement, as by adequate sheathing or subflooring, and ends at point of bearing shall be held in position to prevent rotation and/or lateral displacement.</p>
- 2x12 (d) 5 < d/b ≤ 6; bridging, full depth solid blocking or diagonal cross bracing shall be installed at intervals not exceeding 8 feet, the compression edge of the member shall be held in line as by adequate sheathing or subflooring, and the ends at points of bearing shall be held in position to prevent rotation and/or lateral displacement.
- 2x14 (e) 6 < d/b ≤ 7; both edges of the member shall be held in line for their entire length and ends at points of bearing shall be held in position to prevent rotation and/or lateral displacement.

Analysis Example (pass/fail)

1. Find Max Shear & Moment on Joist

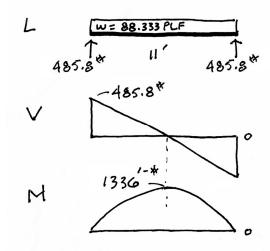

By equations:

Shear:

$$\frac{wl}{2} = \frac{88.336(11)}{2} = 485.848 \text{ lbs}$$

Moment:

$$\frac{wl^2}{8} = \frac{88.336(11^2)}{8} = 1336.08 \text{ ft-lbs}$$

- 2. Determine actual stresses in joists
 - $f_b = M/S$
 - $f_v = 1.5 \text{ V/A}$

$$f_b = \frac{M}{s_x} = \frac{1336' - (12)}{21.39 \text{ is}^3} = 749.5 \text{ PSI}$$

$$f_{v} = \frac{3}{2} \frac{V}{A} = \frac{1.5 (485.8)^{4}}{13.88 in^{2}} = 52.5 PSI$$

C_r Repetitive Member Factor

16" o.c. : $C_r = 1.15$

Repetitive Member Factor, C_r

Bending design values, F_b , for dimension lumber 2" to 4" thick shall be multiplied by the repetitive member factor, $C_r = 1.15$, when such members are used as joists, truss chords, rafters, studs, planks, decking, or similar members which are in contact or spaced not more than 24" on center, are not less than 3 in number and are joined by floor, roof, or other load distributing elements adequate to support the design load.

3.10.4 Bearing Area Factor, Cb

Reference compression design values perpendicular to grain, $F_{c\perp}$, apply to bearings of any length at the ends of a member, and to all bearings 6" or more in length at any other location. For bearings less than 6" in length and not nearer than 3" to the end of a member, the reference compression design value perpendicular to grain, $F_{c\perp}$, shall be permitted to be multiplied by the following bearing area factor, C_b :

$$C_{b} = \frac{\ell_{b} + 0.375}{\ell_{b}} \tag{3.10-2}$$

where:

 ℓ_{b} = bearing length measured parallel to grain, in.

Equation 3.10-2 gives the following bearing area factors, C_b , for the indicated bearing length on such small areas as plates and washers:

Table 3.10.4			Bearing Area Factors, C _b							
- 0	0.5" 1.75						6" or more 1.00			

For round bearing areas such as washers, the bearing length, $\ell_{\rm b}$, shall be equal to the diameter.
