Hot Rolled Shapes

Hot Rolled Shapes

Corten Steel

Develops a rust layer on the surface that protects it from further corrosion.

Developed in the 1930's for railway cars.

Used in the 1960's for architecture.

John Deere Headquarters in Moine, Illinois. Architect Eero Saarinen, 1962

University of Michigan, TCAUP

Nomenclature of steel shapes

Standard section shapes:

W – wide flange

S – American standard beam

C – American standard channel

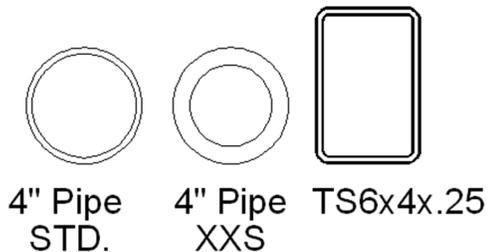

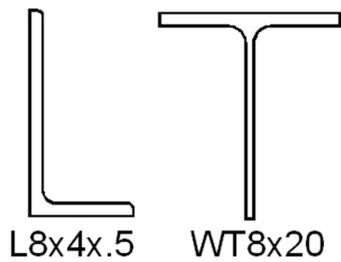

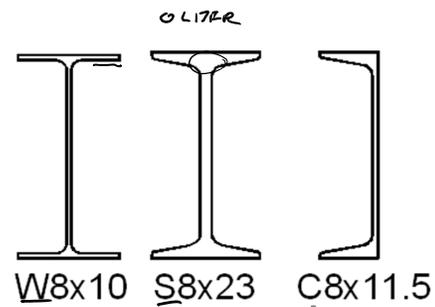

L – angle

WT or **ST** – structural T

STD, **XS** or **XXS** – Pipe

HSS – Hollow Structural Sections
Rectangular, Square, Round

LLBB , **SLBB** - Double Angles

Steel Grades – Rolled Sections

Different sections are made with different grades of steel.

Most structural shapes are:
Gr. 50 Steel with $F_y = 50$ ksi

Older sections were made with:
A-36 Steel with $F_y = 36$ ksi

**Table 2-4

Modified Sections

- Castellated Sections:
- “Boyd beam”
- round, hexagonal, rectangular, sinusoidal
- extendable (added depth)
- cost-efficient
- lightweight

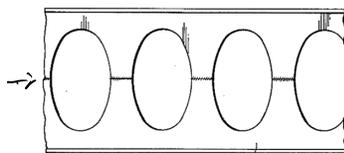

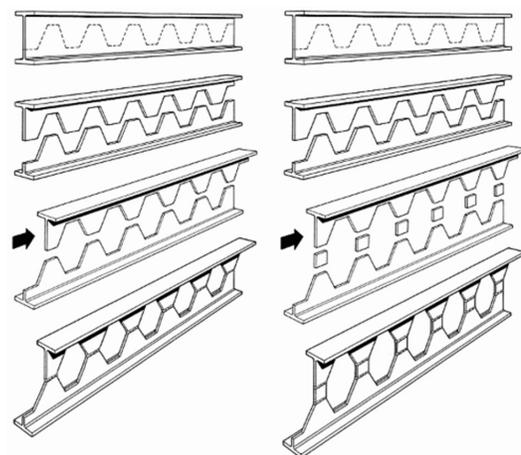

Fig. 2A.

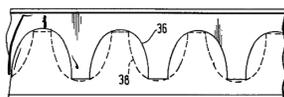

Fig. 2B.

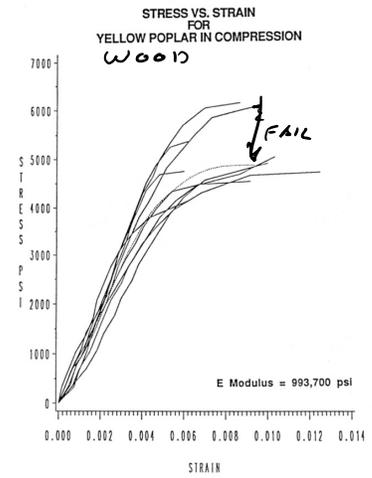

Young's Modulus

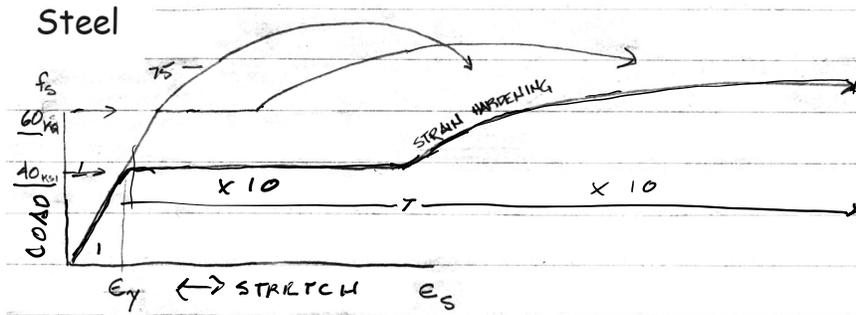

Young's Modulus or the Modulus of Elasticity, is obtained by dividing the stress by the strain present in the material. (Thomas Young, 1807)

$$E = \frac{P/A}{D/L} = \frac{\sigma}{\epsilon}$$

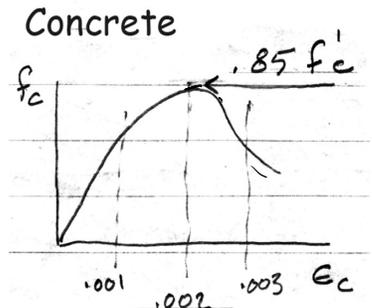

It thus represents a measure of the stiffness of the material.

E = 1000 ksi

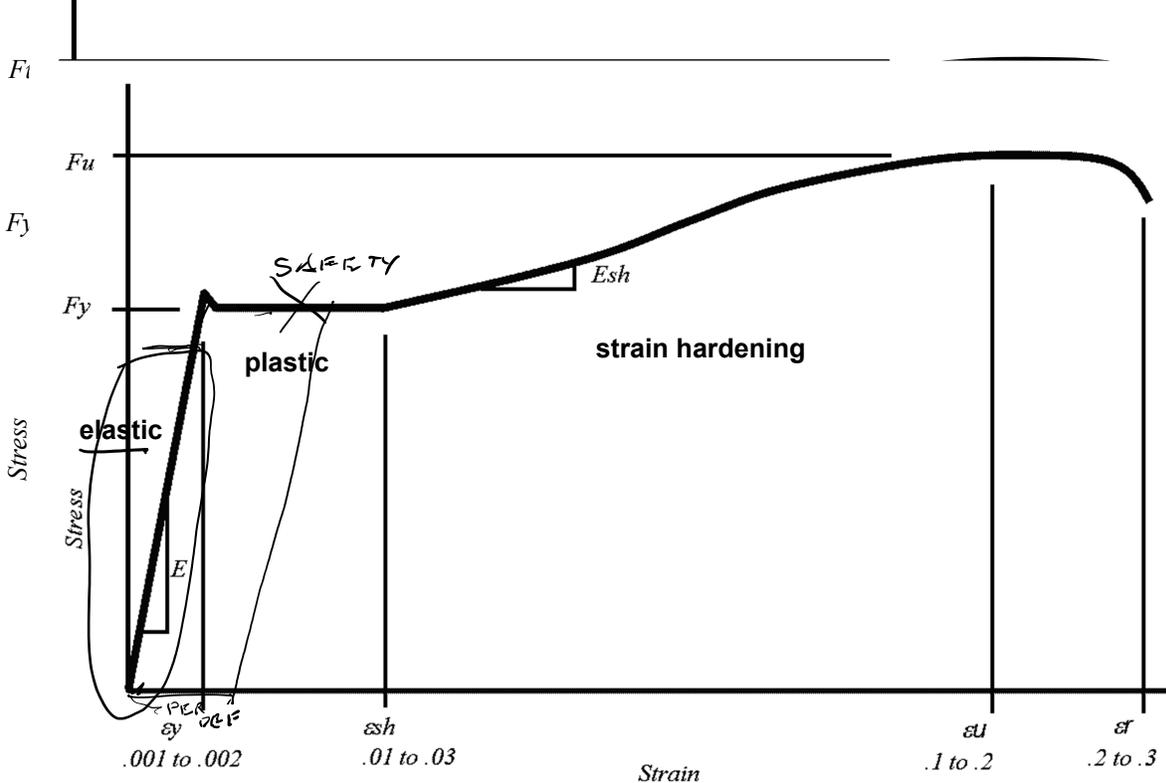

E = 29000 ksi

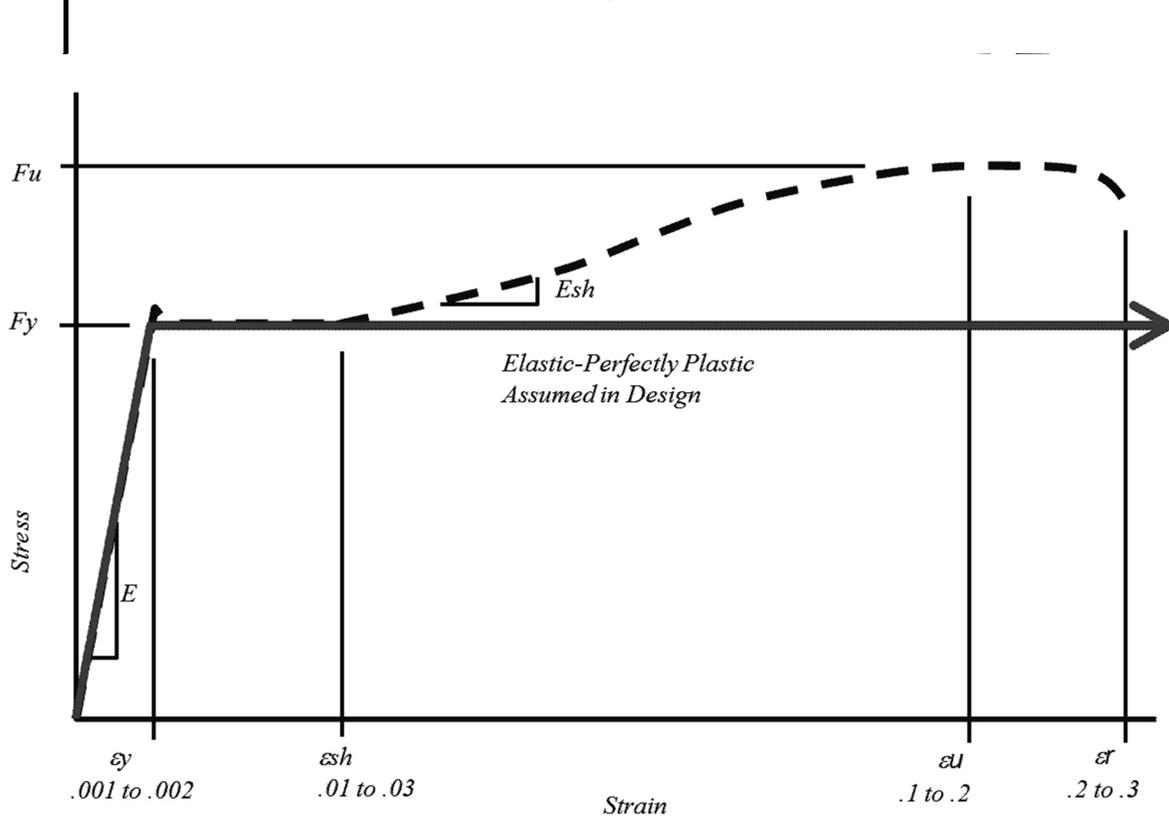

E = 3500 ksi

Stress vs. Strain – mild steel

Stress vs. Strain – AISC design curve

Stress Analysis – Two Methods

Allowable Stress Design (ASD)

- use design loads (no F.S. on loads)
- reduce stress by a Factor of Safety F.S.

$$f_{actual} = \frac{P}{A}$$

$$f_{actual} \leq F_{allowable}$$

$$F_{allowable} = \frac{F_y}{F.S.}$$

Load & Resistance Factored Design (LRFD)

- Use loads with safety factor γ
- Use factor on ultimate strength ϕ

$$P_{load} = \gamma \cdot P_{applied_load}$$

$$P_{load} \leq P_{resisting}$$

$$P_{resisting} = \phi \cdot P_{material_strength}$$

LRFD Analysis

Load & Resistance Factored Design (LRFD)

- Use loads with safety factor γ
- Use forces with strength factor ϕ

$$P_{load} = \gamma \cdot P_{applied}$$

$$P_{load} \leq P_{resisting}$$

$$P_{resisting} = \phi \cdot P_{material}$$

Design Strength

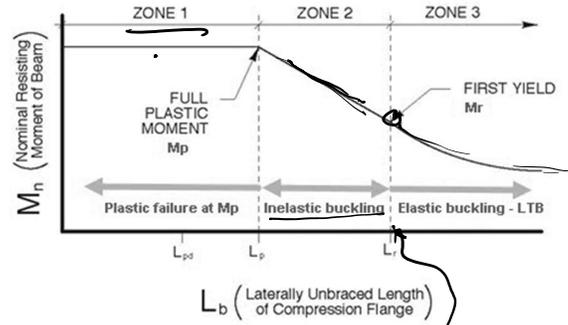

$$P_u \leq \phi P_n$$

Required (Nominal) Strength

2.3 LOAD COMBINATIONS FOR STRENGTH DESIGN

- 1a. $1.4D$
- 2a. $1.2D + 1.6L + (0.5L_r \text{ or } 0.3S \text{ or } 0.5R)$
- 3a. $1.2D + (1.6L_r \text{ or } 1.0S \text{ or } 1.6R) + (L \text{ or } 0.5W)$
- 4a. $1.2D + 1.0(W \text{ or } W_T) + L + (0.5L_r \text{ or } 0.3S \text{ or } 0.5R)$
- 5a. $0.9D + 1.0(W \text{ or } W_T)$

Elastic Analysis for Bending

Plastic Behavior (zone 1)

$$M_n = M_p = F_y Z_x < 1.5 M_y$$

- Braced against LTB ($L_b < L_p$)

Inelastic Buckling "Decreased" (zone 2)

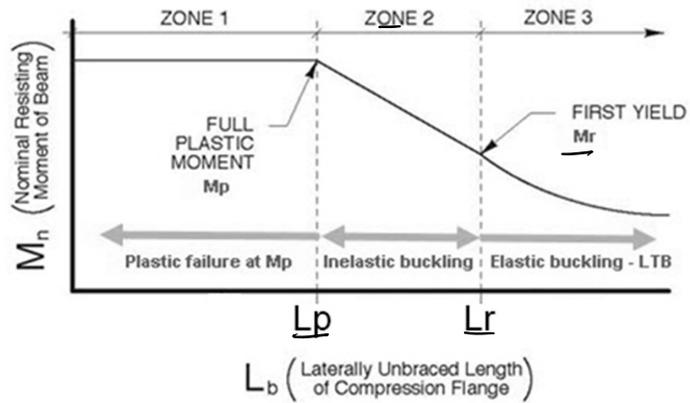

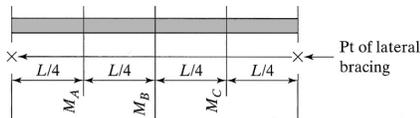

$$M_n = C_b (M_p - (M_p - M_r) [(L_b - L_p) / (L_r - L_p)]) < M_p$$

- $L_p < L_b < L_r$

Elastic Buckling "Decreased Further" (zone 3)

$$M_{cr} = C_b * \pi / L_b \sqrt{(E * I_y * G * J + (\pi * E / L_b)^2 * I_y * C_w)}$$

- $L_b > L_r$

$$L_p = 1.76 r_y \sqrt{E / F_y}$$

$$M_p = F_y Z_x$$

$$M_r = 0.7 F_y S_x$$

C_b is LTB modification factor

$$C_b = \frac{12.5 M_{max}}{2.5 M_{max} + 3 M_A + 4 M_B + 3 M_C}$$

⁽¹⁾Shape exceeds compact limit for flexure with $F_y = 50$ ksi; tabulated values have been adjusted accordingly.

Design for Shear

Steel

Design for Shear

Shear stress in steel sections is approximated by averaging the stress in the web:

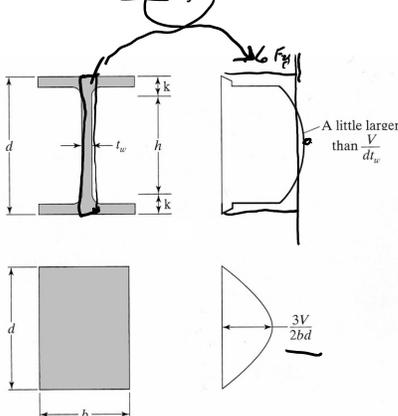

$$F_v = V / A_w$$

$$A_w = d * t_w$$

To adjust the stress a reduction factor of 0.6 is applied to F_y

$$F_v = 0.6 F_y$$

so, $V_n = 0.6 F_y A_w$ (Zone 1)

The equations for the 3 stress zones:
(ϕ in all cases = 1.0)

Zone 1:

WEB YIELDING (Most beam sections fall into this category)

if $\frac{h}{t_w} \leq 2.45 \sqrt{E/F_y} = 59$ (for 50 ksi steel)

then: $V_n = 0.6 F_y A_w$

Zone 2:

INELASTIC WEB BUCKLING

if $2.45 \sqrt{E/F_y} < \frac{h}{t_w} \leq 3.07 \sqrt{E/F_y} = 74$ (for 50 ksi steel)

then: $V_n = 0.6 F_y A_w (2.45 \sqrt{E/F_y}) / \frac{h}{t_w}$

Zone 3:

ELASTIC WEB BUCKLING

if $3.07 \sqrt{E/F_y} < \frac{h}{t_w} \leq 260$

then: $V_n = A_w \left[\frac{4.25 E}{\left(\frac{h}{t_w}\right)^2} \right]$

Design for Shear

No W, M, S or HP section has $h/t_w > 59$

Zone 1:

WEB YIELDING (Most beam sections fall into this category)

$$\text{if } \frac{h}{t_w} \leq 2.45 \sqrt{E/F_y} = 59 \text{ (for 50 ksi steel)}$$

$$\text{then: } V_n = 0.6 F_y A_w$$

Zone 2:

INELASTIC WEB BUCKLING

$$\text{if } 2.45 \sqrt{E/F_y} < \frac{h}{t_w} \leq 3.07 \sqrt{E/F_y} = 74 \text{ (for 50 ksi steel)}$$

$$\text{then: } V_n = 0.6 F_y A_w (2.45 \sqrt{E/F_y}) / \frac{h}{t_w}$$

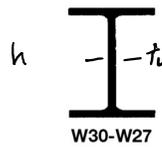

Zone 3:

ELASTIC WEB BUCKLING

$$\text{if } 3.07 \sqrt{E/F_y} < \frac{h}{t_w} \leq 260 \text{ max}$$

$$\text{then: } V_n = A_w \left[\frac{4.25 E}{\left(\frac{h}{t_w} \right)^2} \right]$$
